SPEED-O-COPY in Focusing Position 1

The SPEED-O-COPY was manufactured by D. Paul Schull of Los Angeles California. The SPEED-O-COPY was introduced in 1941.

It is a close-up device designed to be mounted on a tripod or copy stand. It came with a set of extension tubes and a spanner for mounting the camera. My example does not have the tubes or spanner.

The lens and extension tubes were mounted to the base plate and the camera was mounted to a hinged plate. In use the camera was rotated up and the focusing screen was then rotated in place. The unit was focused and framed. The camera was rotated into position, secured with a locking screw and the exposure made.

With the unit placed on a tripod one could take macro-photographs of flowers and such.
